

TREATMENT OF KIDNEY FAILURE FOR ABORIGINAL & TORRES STRAIT ISLANDER PEOPLES OF AUSTRALIA

A summary based on information provided by Australian patients and healthcare teams each year to ANZDATA

A summary of 2018

- 2224 people were recorded again in the annual survey (prevalent patients). They were treated with haemodialysis (1790), peritoneal dialysis (147) and transplant (297)
- Diabetes was the cause of kidney failure for 69 in 100 patients during 2014-2018
- Cardiovascular disease caused most of the 222 deaths in 2018

- **307 Aboriginal and Torres Strait Islander people started kidney failure treatment.**
- Aboriginal and Torres Strait Islander people make up 3% of the Australian population, yet were **4 times more likely to have started haemodialysis** than non-Indigenous Australians.
- **Aboriginal and Torres Strait Islander people aged 25-64 years were 10 times more likely** to start kidney failure treatment than other Australians.
- **More Aboriginal and Torres Strait Islander women** started kidney failure treatment than Aboriginal and Torres Strait Islander men.

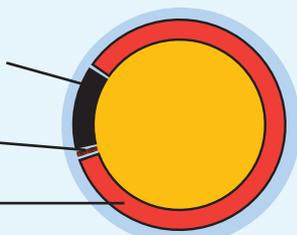

The First Kidney Failure Treatment

Two people had a transplant as their first treatment. Everyone else started with dialysis as their **first** treatment.

Peritoneal Dialysis 12%

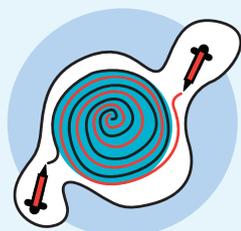

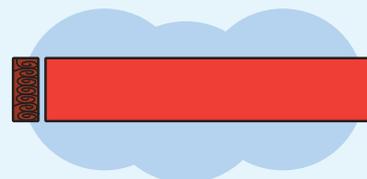

Transplant <1%

Haemodialysis 88%

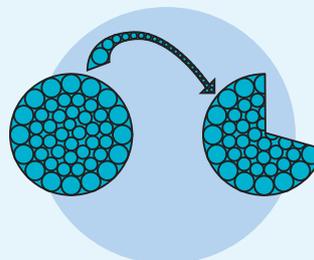

Kidney Transplantation

2 in 100 (2%) existing kidney transplant recipients and 4 in 100 (4%) new kidney transplant recipients were Aboriginal or Torres Strait Islander people.

61 in 100 Aboriginal and Torres Strait Islander people (61%) used a dialysis catheter at the first haemodialysis.

Kidney transplant function at 5 years was recorded in 72 in 100 (72%) Aboriginal and Torres Strait Islander people and 83 in 100 (83%) non-Indigenous Australians.

Care Close to Home

26 in 100 (26%) Aboriginal and Torres Strait Islander people received care close to home as

- Home Haemodialysis (6%)
- Peritoneal Dialysis (7%)
- Functioning Transplant (13%)
