## Renal Replacement Therapy

Table 2.1 shows the prevalence (pmp) of renal replacement therapy in Australia and New Zealand over the last 20 years. The prevalence of both dialysis and transplantation continue to grow in both countries,

although the growth in dialysis prevalence in Australia has slowed in recent years. Table 2.2 shows the same data for the last 5 years, but with dialysis modality categorised.

Table 2.3 and figures 2.1-2.2 show the 2013 prevalence (pmp) of RRT by age groups. In both countries the modal age group was 55-64. The prevalence in the 75-

84 and 85+ age groups was substantially higher in Australia than in New Zealand.

Table 2.4 shows the prevalence (pmp) of RRT by state over 2009-2013. In Australia the Northern Territory has the highest prevalence of dialysis and lowest prevalence

of transplant patients; Tasmania has the lowest prevalence of dialysis patients and the ACT the highest prevalence of transplant patients.

Table 2.5 shows the same data by race. A substantial proportion of Māori and Pacific Peoples were receiving RRT in Australia, but there were no Aboriginal/Torres

Strait Islander patients receiving RRT in New Zealand during 2009-2013.

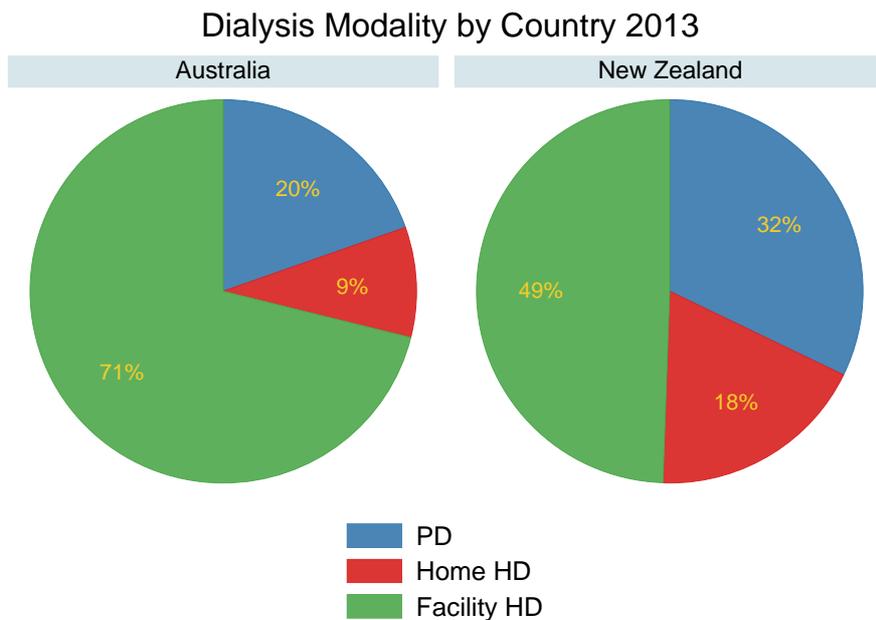

Figure 2.3 shows the overall distribution of RRT modality by country at the end of 2013. The dialysis modalities are shown separately in figure 2.4; a

substantially higher proportion of New Zealand dialysis patients receive dialysis at home (either PD or home HD) than in Australia.

**Figure 2.3**

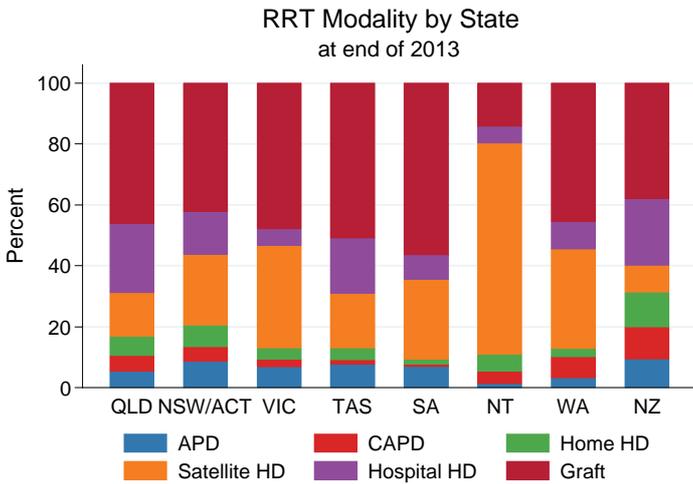

**Figure 2.4**

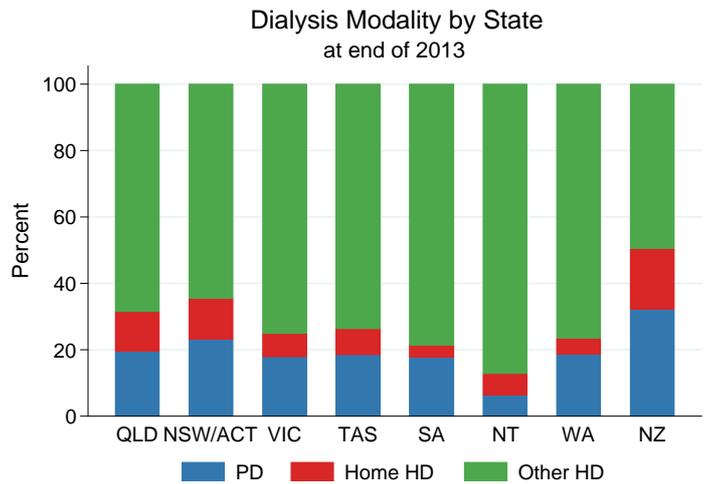

Figures 2.5 and 2.6 show the same data by state. There was substantial variation in the types of RRT received between states, with the biggest outlier being the

Northern Territory in which the large majority of patients were receiving satellite HD.

### Dialysis

Table 2.6 and figures 2.7-2.8 show the age distribution of prevalent dialysis patients in 2013. The dialysis

population in New Zealand is slightly younger than that of Australia.

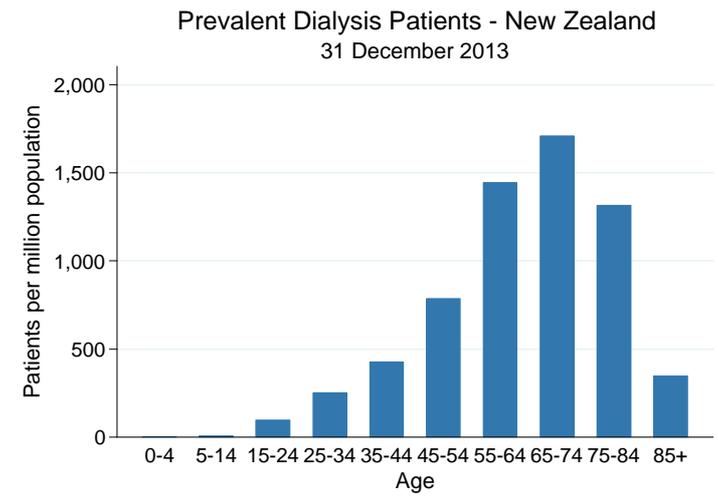

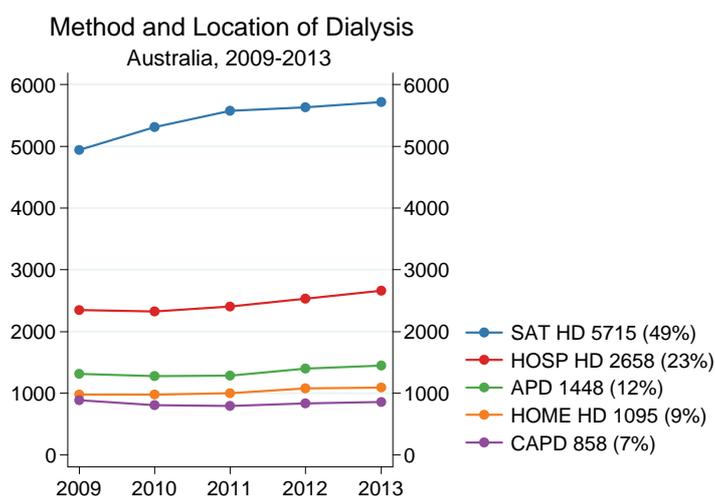

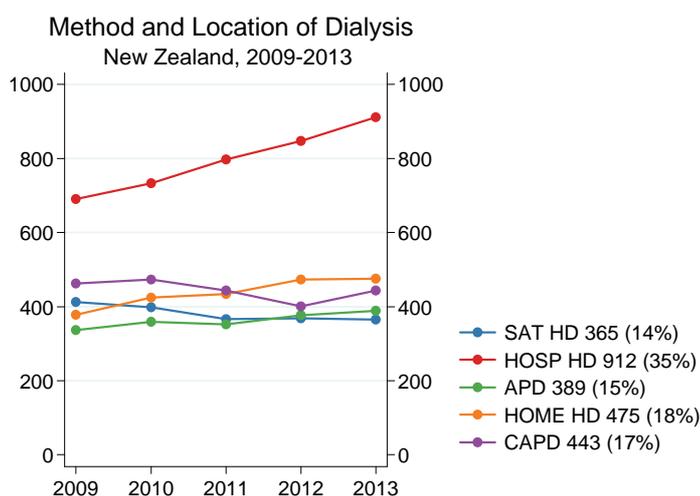

Figure 2.9 and table 2.7 show trends in the method and location of dialysis in Australia and New Zealand over 2009-2013. In Australia most of the growth is in satellite

HD, whereas in New Zealand there is strong growth in hospital HD and weak growth in home HD.

### Co-morbidities

Figure 2.10 shows trends in the prevalence of co-morbidities (with 95% CIs) in prevalent RRT patients over the last 10 years. In general the rates of these co-morbidities are stable, although the prevalence of coronary artery disease and peripheral vascular disease appears to be falling in New Zealand. In general co-

morbidities are less prevalent in New Zealand.

Figure 2.11 shows the prevalence of diabetes. Although the majority of prevalent RRT patients are non-diabetic, there is a strong trend in both countries towards a higher diabetes prevalence.
