The Australia and New Zealand Dialysis and Transplant Registry (ANZDATA) records the incidence, prevalence and outcomes of dialysis and transplant treatment for patients with end-stage kidney disease.

PUBLICATIONS
ANZDATA is the source of a large number of scientific and other publications. Some selected recent publications are listed here. A more complete list is available on our website.

COLLECTS

- Data on chronic dialysis and transplantation
- Indicators of clinical process
- Outcome Data

REPORTS

- Outcome of treatment
- Individual Hospital activity
- Australian and New Zealand data

PROVIDES

For widespread use of its data for Quality Assurance, Audits, Surveys, Service Planning and Research Projects.
INTRODUCTION
This brochure provides an introduction to ANZDATA and includes data collected to the end of 2012, and reported in the 2013 Annual Report. The ANZDATA Registry collects information on renal replacement therapy (dialysis and transplantation) for end-stage kidney disease in Australia and New Zealand. Much more information can be found on our website, including our Annual Report, data forms and dictionaries, list of publications and guidelines for requesting data.

NEW PATIENTS
There were 2534 patients who commenced treatment for end-stage renal failure in Australia in 2011, a rate of 112 per million population. In New Zealand, the number of new patients commencing renal replacement treatment was 513, a rate of 116 per million of population. Rates of treated end-stage kidney disease are substantially higher in Indigenous than non-Indigenous populations in both Australia and New Zealand.

PREVALENT PATIENTS

</table>

At the end of 2012 there were just under 21,000 patients receiving renal replacement therapy in Australia and nearly 4,000 in NZ.

Australia and New Zealand have a strong focus on home dialysis, with 29% of Australian and 50% of New Zealand dialysis patients receiving dialysis at home.

DIALYSIS

ANZDATA has been reporting real-time and annual “key process indicators” (KPIs) for haemodialysis (HD) and peritoneal dialysis (PD) since 2011. At present for HD we report the proportion of new patients starting HD with a fistula or graft. There is a large variation between treating hospitals.

A relatively large proportion of dialysis patients in Australia and New Zealand use PD. The main reasons for technique failure are patient preference, infective complications and death.
