

CHAPTER 7

Kidney Transplantation

Reporting the incidence and prevalence of renal transplantation in Australia and New Zealand; summarizing immunosuppression regimens, rejection episodes and graft and patient survival.

Executive Summary

During 2017, there were 1,109 kidney transplants performed in Australia and 187 performed in New Zealand, with live donor transplants contributing 24% and 37% of total transplants, respectively. The 31% growth in kidney transplants between 2012 and 2017 in Australia parallels the increase in the number of deceased donors, whereas the number of live donors has remained unchanged. In New Zealand, there has been a 73% growth over the same period, with corresponding increases of 119% and 28% in deceased and live donor transplants, respectively. There is a substantial geographical variation in the transplantation rate in Australia, with Tasmania and Victoria having the highest transplant rate of dialysed patients in 2017. Even though the number of kidney transplants in every ethnic group has increased over time, Caucasian patients contribute to 70% and 46% of total patients transplanted in Australia and New Zealand, respectively; whereas Aboriginal/Torres Strait Islander and Māori patients contribute 3% and 12%, respectively (2017 data).

The number of prevalent patients with functioning kidney transplants has grown in the last decade, increasing by 53% between 2008 and 2017 (from 7,658 to 11,687 recipients) in Australia, and by 40% (from 1,354 to 1,890 recipients) in New Zealand. At the end of 2017, 10% and 12% of prevalent transplants had functioned for at least 20 years in Australia and New Zealand, respectively. Death with a functioning graft and chronic allograft nephropathy are the two most common causes of allograft failure, accounting for 47% and 31% of all allograft failures in Australia, respectively; and 62% and 22% in New Zealand, respectively (2017 data). Cancer is the most common cause of death with a functioning graft in Australia, whereas cardiovascular disease remains the most common in New Zealand.

The proportion of first kidney transplant recipients who had experienced acute rejection in the first 6 months has reduced over the last 5 years for recipients of deceased donor kidneys (from 20% in 2011 to 15% in 2017), but has remained unchanged for recipients of live-donor kidneys (17% in 2011 and 2017). There has been considerable improvement in short and intermediate-term allograft and patient survivals following live and deceased donor kidney transplants since 1990, with 1-year (95% confidence interval) allograft survival in Australia for primary live and deceased donor kidney transplants of 99% (98%, 100%) and 94% (93%, 96%), respectively; and 96% (90%, 98%) and 96% (91%, 98%) in New Zealand, respectively (2016-2017 data).

New Transplants

Table 7.1 shows the number of transplants performed in each country over the last 20 years. The 1109 transplants performed in Australia in 2017 represent the highest number ever performed. This is predominantly driven by large growth in deceased donor kidney transplants (figure 7.1); after a peak in 2008, living donor numbers have returned to pre-2008 levels. In New Zealand total transplant activity has increased in the last four years, driven primarily by strong growth in the number of deceased donor transplants.

Figure 7.1.1 - Deceased and Living Donor Transplants - Australia 2008-2017

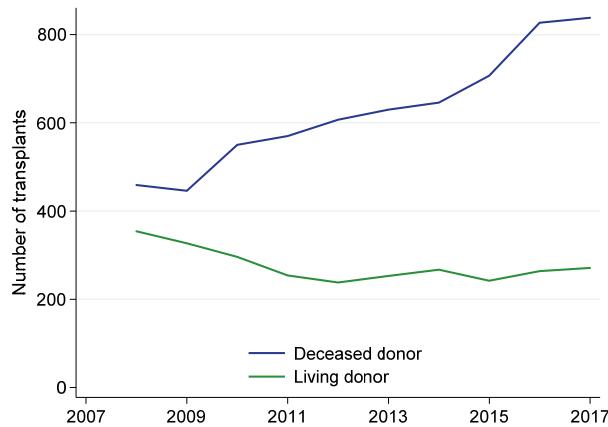

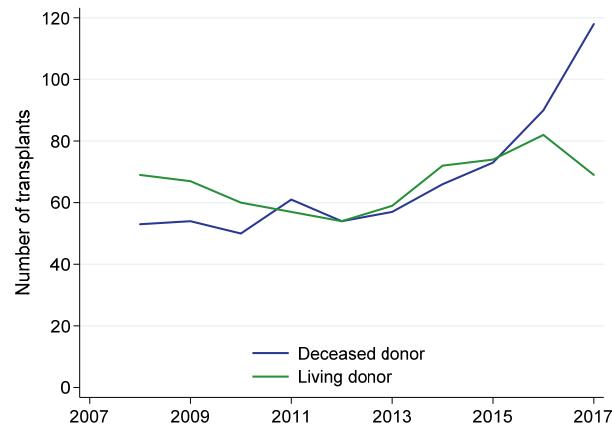

Figure 7.1.2 - Deceased and Living Donor Transplants - New Zealand 2008-2017

The transplant rate of dialysed patients is presented in figure 7.2 (for all dialysis patients) and figure 7.3 (for patients aged 15-64 years). Note that the denominator for these rates is dialysis-years. Differences in the rates between states and countries depend on a number of factors including the casemix of the dialysis patients and the local deceased donation rate. These rates are presented by age in figure 7.4, and by ethnicity in patients aged 15-64 years in figure 7.5. In both countries, the transplant rate of indigenous patients is lower than in other ethnic groups; see also chapter 10.

	Māori	9 (7.8%)	22 (15.9%)	28 (19.0%)	25 (14.5%)	23 (12.3%)
	Pacific	8 (6.9%)	16 (11.6%)	21 (14.3%)	28 (16.3%)	40 (21.4%)
	Other	1 (0.9%)	3 (2.2%)	2 (1.4%)	7 (4.1%)	8 (4.3%)
	Not reported	1 (0.9%)	-	-	6 (3.5%)	3 (1.6%)
	Total	116	138	147	172	187

Table 7.4 shows the number of transplants (per million population) performed by transplanting region over 2013-2017. Transplants performed for patients residing in Tasmania and the Northern Territory are included in the figures for Victoria and South Australia regions, respectively. These regions share common waiting lists and allocation protocols.

Table 7.4 Transplants (pmp) by Transplanting Region and Country 2013-2017

State	2013	2014	2015	2016	2017
NSW/ACT	288 (37)	300 (38)	331 (41)	348 (43)	367 (44)
VIC/TAS	267 (42)	306 (48)	303 (46)	352 (53)	364 (53)
QLD	149 (32)	145 (31)	139 (29)	199 (41)	190 (39)
SA/NT	81 (42)	85 (44)	89 (46)	95 (48)	70 (36)
WA	98 (39)	77 (31)	87 (34)	97 (38)	118 (46)
Australia	883 (38)	913 (39)	949 (40)	1091 (45)	1109 (45)
New Zealand	116 (26)	138 (31)	147 (32)	172 (37)	187 (39)

Each year a small number of Australian and New Zealand dialysis patients travel overseas to receive a kidney transplant. The numbers of such procedures over 2008-2017 are presented in table 7.5. It is possible that these numbers are an underestimate of the true number, since some patients may not return to Australia/New Zealand and hence be reported to ANZDATA registry as lost to follow-up.

Table 7.5 Transplant Operations Performed Overseas on Australian/NZ Dialysis Patients 2008-2017

Year	Australia	New Zealand

2015	6	1
2016	2	1
2017	1	1

Prevalent Transplants

This section presents the number of prevalent (functioning) transplants according to various categories.

Table 7.6 presents the total number of transplants performed (in Australia and New Zealand, categorised by country of transplant) and functioning at the end of 2017 (categorised by country of residence). The patients with transplants of “unknown” source were transplanted outside Australia/New Zealand.

Table 7.6 Total Number of Transplants Performed and Functioning at End of 2017

Country	Donor type	Graft number	Performed	Functioning
Australia	Living	1	5609	3626
		2	540	319
		3	75	54
		4	10	7
		5	1	0

		4	7	0
	Unknown	1	0	7

Table 7.7 presents the number of functioning transplants at the end of 2008-2017 by transplant regions. In Australia, SA/NT has the highest prevalence of transplant patients per million population (597 pmp) and WA the lowest (434 pmp). These data are shown graphically in figures 7.7 and 7.8.

Table 7.7 Functioning Transplants (pmp) by Transplanting Region 2008-2017

Year	NSW/ACT	VIC/TAS	QLD	SA/NT	WA	Australia	New Zealand
2008	2385 (327)	2104 (366)	1506 (357)	911 (504)	752 (346)	7658 (360)	1354 (318)

2017	3610 (436)	3585 (524)	2197 (446)	1176 (597)	1119 (434)	11687 (475)	1890 (394)

Figure 7.7 - Functioning Transplants by Transplanting Region - Australia 2008-2017

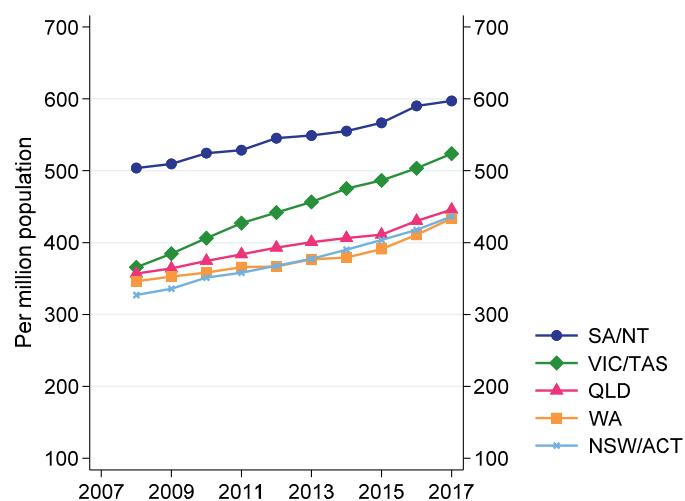

Figure 7.8 - Prevalence of Functioning Transplants 31 Dec 2017 - Per Million Population

The age distribution of prevalent transplant patients as a proportion of patients on renal replacement therapy is shown in figure 7.9. There is a greater proportion of functioning live-donor grafts in younger patients. The number of prevalent transplant patients by age and donor source is shown in table 7.8. Finally, the age distribution, and distribution per million population, are shown in figures 7.10 and 7.11 for Australia and New Zealand, respectively.

Figure 7.12 shows the duration of function of prevalent transplants at the end of 2017. In Australia there were 4038 grafts that had functioned for ≥10 years, 1140 ≥20 years and 265 ≥30 years. In New Zealand there were 732 grafts that had functioned for ≥10 years, 230 ≥20 years and 49 ≥30 years.

Figure 7.12.1 - Number and Duration of Functioning Grafts - Australia 2017 (n=11687)

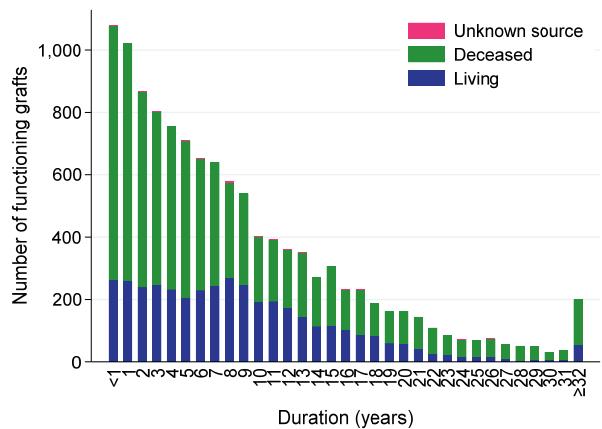

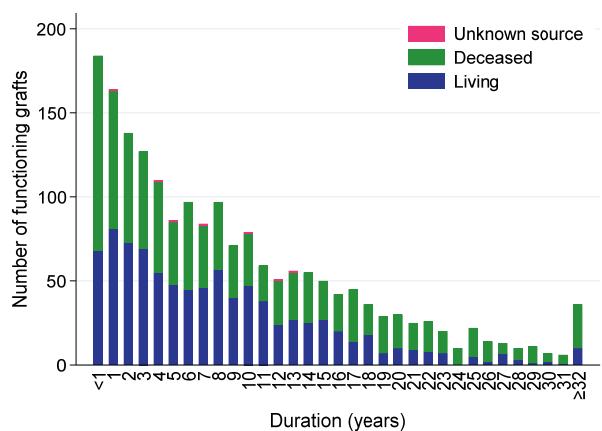

Figure 7.12.2 - Number and Duration of Functioning Grafts - New Zealand 2017 (n=1890)

Graft Loss

Table 7.10 presents the overall graft loss rate in 2008-2017 by country, stratified into graft failure and death with a functioning graft. These rates are expressed as graft losses per 100 graft-years. In general, around half of grafts are lost due to graft failure and half due to patient death.

Table 7.10 Graft Loss Rate 2008-2017

Country	Outcome	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Australia	Graft failure	3.4	3.2	2.7	2.8	3.1	2.7	2.8	3.1	2.7	2.9
	Death with function	2.5	2.1	2.3	2.8	2.1	2.7	2.5	2.5	2.6	2.2
	All losses	5.9	5.3	5.1	5.7	5.2	5.4	5.3	5.7	5.3	5.0
New Zealand	Graft failure	2.4	2.8	2.3	2.3	2.7	2.4	3.0	2.1	2.8	2.0
	Death with function	2.0	2.7	2.5	3.0	2.2	2.1	3.0	2.8	3.2	3.0
	All losses	4.4	5.5	4.7	5.3	4.9	4.5	5.9	4.9	6.0	5.1

The causes of graft loss over 2008-2017 are presented in table 7.11. Chronic allograft nephropathy dominates the causes of graft failure, whilst graft failure due to acute rejection is an uncommon event (<3%). These data are further categorised by timing post-transplant (first year versus later years) for 2013-2017 in table 7.12. Cancer and cardiovascular disease are the most common causes of death with a functioning graft in both Australia and New Zealand.

Table 7.11 Causes of Graft Loss 2008-2017

Immunosuppressive therapy at baseline, 1 and 2 years post-transplant for primary grafts over 2010-2017 is presented for deceased and living donors in tables 7.14 and 7.15, respectively. Tacrolimus is the most commonly prescribed calcineurin inhibitor in Australia, whereas in New Zealand cyclosporin predominates.

Table 7.14.1 Immunosuppressive Therapy - Primary Deceased Donor Grafts Australia 2010-2017

Rejection

The proportion of patients experiencing any rejection episode by 6 months post-transplant, stratified by donor type and graft number, is presented in table 7.16. Antibody-mediated rejection rates are presented in table 7.17; rates are notably higher in re-grafts. Years shown are those in which the transplants took place.

Table 7.16 Rejection Rates at Six Months Post Transplant 2007-2016

Donor Type	Graft Number	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Living donor	First	21.4%	17.0%	16.8%	17.8%	17.5%	14.1%	19.2%	22.4%	17.1%	17.4%
	Second and subsequent	34.3%	30.0%	24.3%	12.9%	19.2%	10.0%	16.1%	28.6%	11.1%	16.7%
Deceased donor	First	17.7%	22.0%	21.1%	19.1%	20.0%	16.8%	18.6%	19.8%	17.7%	15.2%
	Second and subsequent	32.8%	32.9%	37.8%	28.6%	19.4%	24.4%	25.0%	25.9%	24.7%	18.6%

Table 7.17 Antibody-Mediated Rejection Rates at Six Months Post Transplant 2007-2016

Donor Type	Graft Number	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Living donor	First	3.4%	3.1%	4.5%	3.7%	4.9%	2.3%	5.0%	4.6%	3.9%	3.9%
	Second and subsequent	20.0%	12.5%	13.5%	3.2%	11.5%	6.7%	3.2%	5.7%	5.6%	2.8%
Deceased donor	First	5.8%	4.8%	5.6%	5.4%	5.6%	3.9%	5.0%	5.1%	6.0%	5.8%
	Second and subsequent	10.9%	15.8%	24.3%	13.0%	11.3%	10.3%	10.3%	12.9%	17.6%	8.6%

Table 7.18 shows the number of people who received antibody agents for treating acute rejection by calendar year. The number is also reported as a proportion of new transplant recipients in each calendar year, but readers should be aware that although the large majority of people experiencing acute rejection do so within the first six months of transplantation, some experience rejection after this time (when they would not necessarily be counted as a new transplant). For this reason the total number of transplant recipients treated during the year is also reported.

Table 7.18 Antibody Therapy for Acute Rejection 2013-2017

Country	Type of agent	2013	2014	2015	2016	2017
Australia	Intravenous immunoglobulin	104 (11.8%)	96 (10.5%)	163 (17.2%)	119 (10.9%)	118 (10.6%)
	Anti-CD25	1 (0.1%)	1 (0.1%)	2 (0.2%)	1 (0.1%)	-
	Rituximab	11 (1.2%)	12 (1.3%)	12 (1.3%)	4 (0.4%)	7 (0.6%)
	T cell depleting polyclonal Ab	51 (5.8%)	37 (4.1%)	31 (3.3%)	23 (2.1%)	40 (3.6%)
	Not specified	15 (1.7%)	28 (3.1%)	24 (2.5%)	45 (4.1%)	32 (2.9%)
	Total new transplants	883	913	949	1091	1109
NZ	Total transplants at risk	10151	10581	11032	11581	12174
	Intravenous immunoglobulin	2 (1.7%)	8 (5.8%)	1 (0.7%)	6 (3.5%)	3 (1.6%)
	Anti-CD25	1 (0.9%)	-	-	-	-
	Rituximab	1 (0.9%)	7 (5.1%)	-	2 (1.2%)	-
	T cell depleting polyclonal Ab	4 (3.4%)	7 (5.1%)	3 (2.0%)	14 (8.1%)	13 (7.0%)
	Not specified	1 (0.9%)	3 (2.2%)	5 (3.4%)	-	2 (1.1%)
	Total new transplants	116	138	147	172	187
	Total transplants at risk	1642	1714	1776	1875	1968

Patient and Graft Survival

The remainder of the chapter presents patient and graft survival by transplant era and within a number of different categories combining country, graft number and donor type. Each page shows the patient and graft survival graphically, and in tabular form (with 95% confidence intervals) at selected time-points post-transplant. In each case the survivor function is calculated using the Kaplan-Meier method. Graft survival is not censored for death. All of these survival statistics are unadjusted. Note that in the survival graphs out to 5 years, the y axis ranges from 0.60 to 1.00 in order to show the differences between the eras more clearly, whereas in the long-term graphs (out to 30 years) the y axis starts at 0.
