Stock and Flow

The waiting list data reported here are derived from the Australian National Organ Matching System (NOMS) and ANZDATA. Waiting list data refers to waiting for deceased donor (DD) kidney-only transplants. Patients wait-listed for multi-organ transplants are excluded. Recipients of living donor (LD) transplants may or may not be on the waiting list prior to transplantation. To understand the relative contributions of deceased and living donor transplants to patients on (and off) the kidney-only waiting list, DD and LD transplants to recipients not on the kidney-only waiting list are also included.

The numbers of people moving on and off the active waiting list for any reason are shown. Patients are categorised as either active or off the list - an "interim" or "temporarily off list" status is considered to be off list, since these patients will not be allocated kidneys. A number of de-listed patients may return to the list in subsequent years. If a patient was listed and de-listed more than once in a calendar year, only the net change is counted.

Table 7.1 shows the basic stock and flow tables for Australia for each year. Due to the recent increase in organ donor numbers, the number of patients waiting for a kidney transplant has been falling over time despite

In the tables below, the rows describe:

- Number on the active list at the beginning of the year
- Number added to the active list during the year
- Number removed from the active list during the year
- Number of deceased donor (DD) transplants to people on the waiting list
- Number of living donor (LD) transplants to people on the waiting list
- Number of transplants performed outside Australia / New Zealand to people on the waiting list
- Number who died while on the active waiting list
- Number on the waiting list at the end of the year

increasing numbers of patients being listed each year. However, in 2014 large numbers of listings led to a rise in the number waiting.

Table 7.1. Australian Kidney Transplant Waiting List Stock and Flow 2009-2014

Event	2009	2010	2011	2012	2013	2014
Active start of year	1252	1266	1185	1087	1075	1071

The numbers of both dialysis patients and transplants vary with age; in table 7.3 the stock and flow for the years 2010-14 is shown by broad age groups. As

expected, older patients are less likely to be listed than younger patients, and the proportion removed from the list is higher.

Table 7.3. Australian Kidney Transplant Waiting List Stock and Flow by Age 2009-2014

Age Group	Event	2009	2010	2011	2012	2013	2014

Differences between states (combined into transplanting regions) are shown in table 7.4. Approximately half of all patients on the waiting list are in NSW. Waiting list

numbers in each state are reflective of both listing practices and donation rates, both current and historical.

Table 7.4. Australian Kidney Transplant Waiting List Stock and Flow by State 2009-2014

State	Event	2009	2010	2011	2012	2013	2014

Proportion of patients transplanted or on waiting list

Figure 7.1 shows the proportion of prevalent RRT patients who were either transplanted or actively wait-listed at the end of 2014, by state and age group. In all states and all age groups, the majority of dialysis patients were not actively wait-listed at the end of 2014.

Younger patients are more likely to be transplanted or wait-listed, and the proportion of dialysis patients wait-listed varies substantially by state.

Figure 7.1

Proportion of patients transplanted or on waiting list By state and age, end 2014

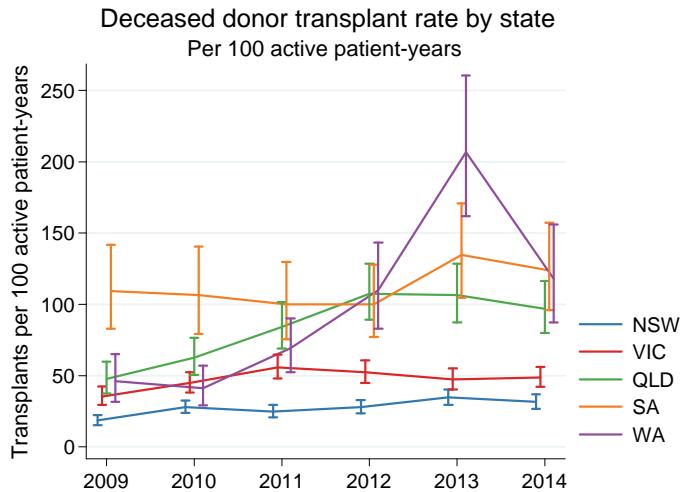

Transplant Rate

The transplant rate represents the likelihood of receiving a kidney transplant in patients who are actively wait-listed. For these analyses the transplant rate was calculated as the number of deceased donor kidney-only transplants performed (numerator) per 100 patient-years on the active kidney-only waiting list

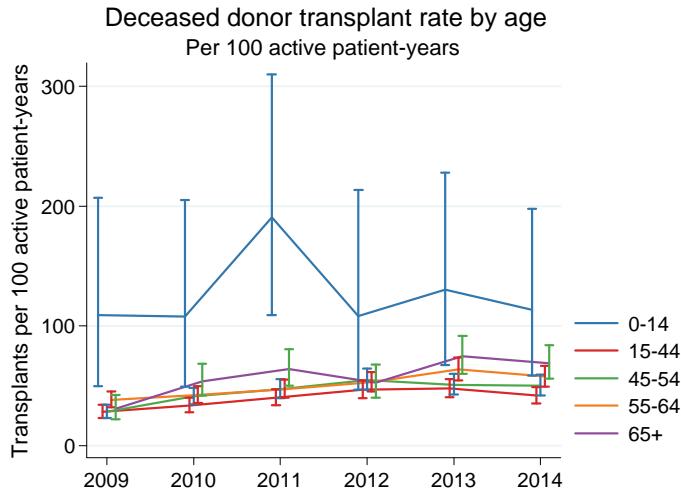

(denominator). The transplant rate depends on the number of organs available, the number of patients on the waiting list, and the kidney allocation system. Figures 7.2-7.5 show the transplant rate by state, age, race and blood group respectively.

Figure 7.2

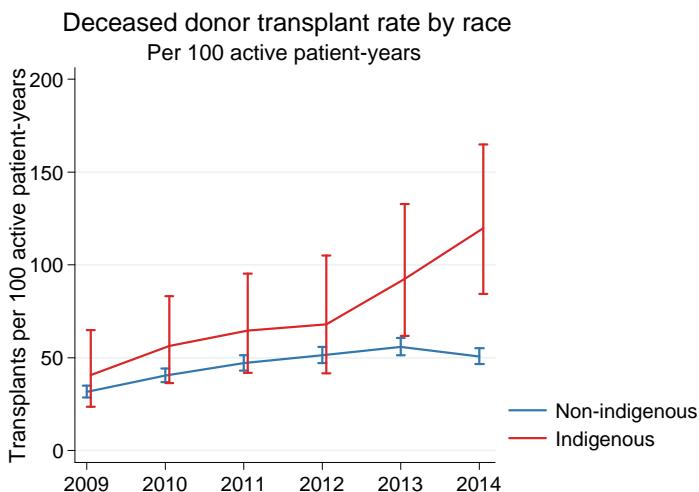

The transplant rate is typically highest in SA (figure 7.2).

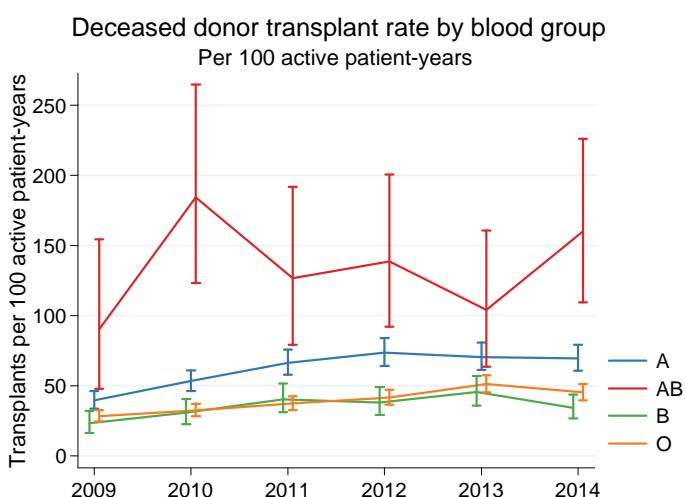

Figure 7.3

Paediatric patients are preferentially allocated kidneys and so have a higher transplant rate than adult patients; since the allocation system otherwise ignores age, patients in other age groups have the same transplant rate (figure 7.3).

Figure 7.4

Despite a slightly different HLA profile, indigenous patients do not have a lower transplant rate once actively wait-listed (figure 7.4).

Figure 7.5

Blood group AB patients have the highest transplant rate due to their compatibility with all donors (Figure 7.5)

Waiting List Demographics

Table 7.6 shows the demographic characteristics of actively wait-listed patients over 2009-2014. In general the demographics are very stable. However, there has been a slight increase in the proportion of highly sensitised patients (historical peak PRA \geq 80%, from 9% in 2009 to 13% in 2014) and in the proportion of patients with diabetes (from 15% in 2009 to 21% in 2014).

Note that the peak PRA data presented here are calculated as the highest class I PRA ever recorded, whereas for the purposes of kidney allocation the peak PRA is the PRA of the peak serum still available for testing. Thus, the values reported here are slightly higher than those reported by NOMS and used for allocation.

Table 7.6. Demographics of the Australian Kidney Transplant Waiting List 2009-2014

Factor	2009	2010	2011	2012	2013	2014
N	1266	1185	1087	1075	1071	1123

Survival on the Waiting List

Figure 7.6 shows the survival of patients who commenced dialysis in Australia over 2009-2014 and were subsequently wait-listed for a deceased donor kidney-only transplant. Survival is shown from the time

of listing and is censored at transplantation (but not at removal from the list). The mortality rate of this highly selected patient group was low at 1.8 deaths per 100 patient-years (95% CI 1.4-2.4).
